

Drive & Idle Disc Drum

Drum description

When a Multi Eye Link Belt, Plate Link Belt, or a Hybrid Belt will be used for a high capacity industrial application with high loads, and/or being in a freezing application or an environment with cumulative waste, DK Transportbaand will always recommend the Drive & Idle Disc Drum. The Drive & Disc Disc Drum ensures an equal transmission of power from the drum to the conveyor belt over the entire width of the belt, thereby creating a longer life-span of the belt and cage drum. Furthermore, the belt is designed for applications with cumulative waste or weight, thereby being ideal for freezing applications.

With high capacity production and high loads, positioning of the belt is key to ensure a smooth production flow. The Drive & Idle Cage Drum is engineered for optimal positioning of the belt to ensure a smooth production flow.
